'Providing Tribological Solutions'

NEWS RELEASE

VSG Drums and Kegs have Liners

VSG® is a canola oil based lubricating grease with a state of the art calcium sulphonate thickener. It is an NLGI Consistency Grade 1. This grease has many ecological and performance advantages over standard greases and even self-lubricating bearings.

One of the advantages of a grease is that it tends to stay in place and can be sticky. This is good in a bearing and to reduce grease migration and/or water washout, but can be a disadvantage when a keg or drum is being changed.

Plus, many locations have restrictions on how much residual grease can be left in used steel kegs and drums when these are being sent for disposal or reuse. There can also be a cost penalty.

To make it easier, all VSG steel kegs and drums now have a disposable flexible plastic liner. This is made of LDPE which can be recycled where allowed.

The use of a flexible liner makes it much easier to get out the last bit of grease and to add it to the new container as well as to be able to quickly clean out the containers for reuse, recycling or disposal.

As a caution to reduce the chances of the liner being pulled down by the follower plate used with grease pumps, it is suggested that the loose end of the liner at the top be taped to the container.

Our 'green' grease is even greener.

VSG is available in tubes, pails, kegs and drums. Please contact us for specific references and/or a free comparison with your current grease.
